

Fairy Floss Operating Instructions

1. Screw on legs, place machine on level surface, bowl fits around collar, bubble fits into bowl groove.
2. With both switches **off** connect lead to machine and fill head with sugar. Turn on motor switch, seconds later switch on heat and turn heat control knob to position 5.
3. In a few minutes floss will appear and form a ring on bowl sides.
4. If floss does not stick to bowl but flies or balls, dampen side of bowl with wettex, this gives floss something to cling to. **Turn control back to about half way**, head will produce floss but not as fast.
5. The secret of good floss operation is the position of the heat control, so experiment until you are familiar with what it will do.
6. Place stick inside ring of floss formed, twist stick in your fingers at the same time going in an **ANTI-CLOCKWISE** direction. Don't roll floss against side of pan —this will only compress it. Get floss well up stick and continue until sufficient floss, about 20x10cm is right, but this depends on your generosity.
7. depends on your generosity.
8. Don't run machine too hot as this will make hot ropey floss, waste your sugar and burn the floss.
9. Keep bowl clear of thrown floss. Avoid build-up in bowl and around head collar. Every 5 or 6 sticks refill head or floss will burn. On warm, damp humid days it may help to work without bubble.
10. If floss blows around bowl, dampen sides of bowl. Floss will then cling to bowl.
